

# Exploring Transportation Safety Evaluation

December 15, 2021 11AM EST

**Stephen Read**, Virginia DOT & AASHTO Highway Safety Manual Steering Committee Chair

**Bonnie Polin**, Massachusetts DOT & AASHTO Highway Safety Manual Steering Committee Co-Chair

**Kelly Hardy**, AASHTO

# Exploring Transportation Safety Evaluation

This webinar features infrastructure transportation safety evaluation approaches, tools and outcomes employed by state transportation agencies around the United States.

**Stephen Read**, Virginia DOT & AASHTO Highway Safety Manual Steering Committee Chair

**Bonnie Polin**, Massachusetts DOT & AASHTO Highway Safety Manual Steering Committee Co-Chair

**Kelly Hardy**, AASHTO

**Frank Gross, Ph.D.**  
**VHB, NCHRP 52-08**

TRANSPORTATION RESEARCH BOARD

# Practices for Balancing Safety Investments in a Comprehensive Safety Program

NCHRP Synthesis 52-08

**Frank Gross**

*VHB Safety Practice Leader*

December 7, 2021

# Project Goals

Document current State DOT practices for:

- Identifying HSIP projects
- Prioritizing HSIP projects
- Evaluating HSIP projects

Look for differences in:

- State vs. local projects
- Spot, systemic, and systematic approaches

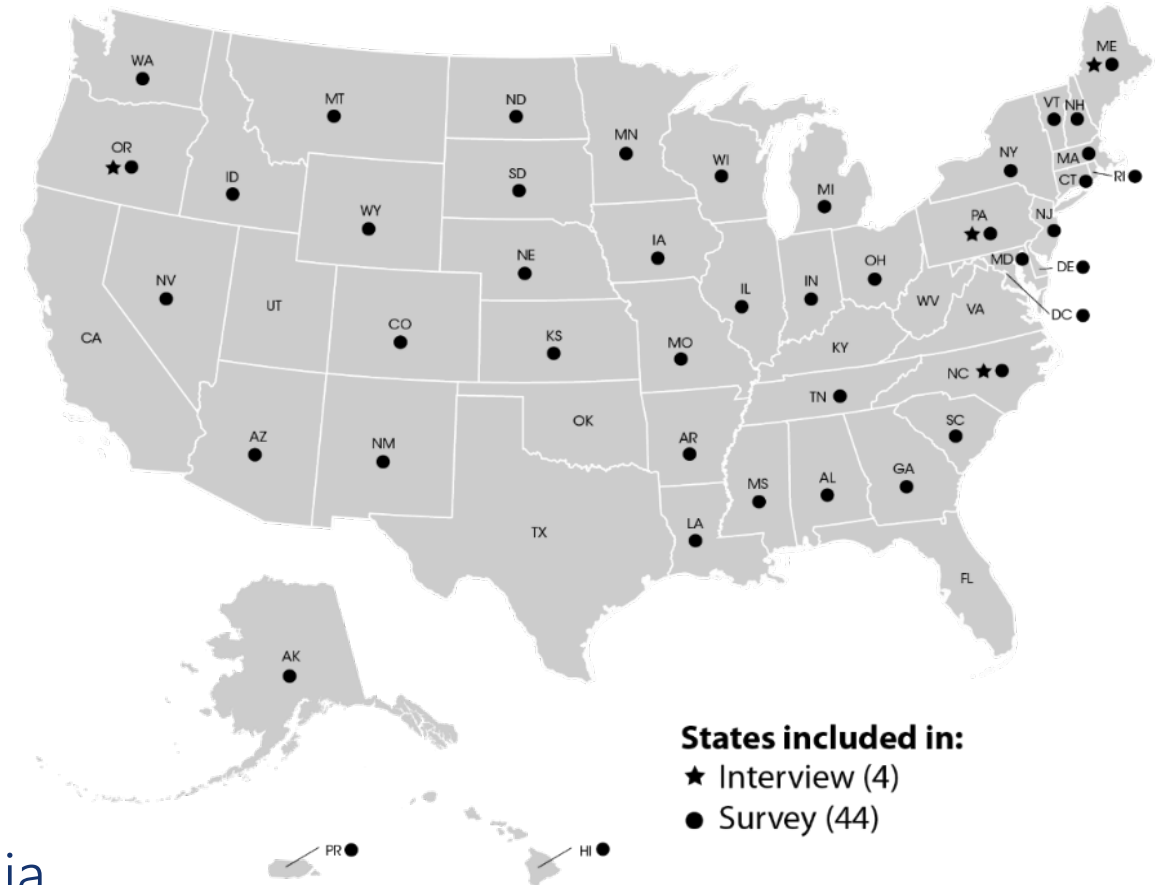

# Approach

Three primary sources:

1. Literature review
  - 36 State HSIP/Safety Program manuals
  - State HSIP annual reports
  - Federal and State HSIP resources
2. Survey of State safety programs
  - 44 DOTs (85% response rate)
3. In-depth interviews (case examples)
  - Maine, North Carolina, Oregon, Pennsylvania

# Project Evaluation Summary

1. State DOT guidance on project evaluations
  - **Ranges:** no reference to detailed procedures
2. Evaluation methods
  - **Simple before-after** is most common for project evaluations
  - Some states use **more reliable methods to develop CMFs**
3. Differences by project type (e.g., spot vs. systemic or State vs. local road)
  - **Most states use same framework/method** for evaluating all projects

# Survey Results

## Project evaluation methods on State system

Method	Spot	Systemic
Simple before-after	32	23
Empirical or Full Bayes before-after	10	9
Comparison group before-after	5	8
Regression cross-section	1	1
Other	4	6
We don't evaluate	5	9

# Survey Results

## "Other" methods

- Colorado: has not determined a methodology for systemic projects *yet*
- Connecticut: plans to hire consultant to conduct before-after studies
- Illinois: depends on data availability
- Maryland: spot projects evaluated on case-by-case basis
- Massachusetts: EB method when possible; alternative methods as needed; no evaluation of Every Day Counts initiatives and proven countermeasures
- Michigan: performs before-after studies separately for State and local projects
- Ohio: performs before-after studies with traffic volume correction

# Survey Results

Different evaluation method  
on Local system?

Project evaluation methods on Local system

Method	Spot	Systemic
Simple before-after	4	3
Empirical or Full Bayes before-after	2	1
Comparison group before-after	1	1
Regression cross-section	0	0
Other	2	4
We don't evaluate	4	3

# Survey Results

## "Other" methods

- Maryland: developing program to allocate HSIP funds to locals starting in FY22. No evaluations done yet.
- Michigan: performed analysis of FY 2013 local agency programs to assess program and countermeasure effectiveness. Assessed projects, countermeasures, and program using two techniques: simple before-after and Empirical Bayes before-after.
- New York: currently has Post Implementation Evaluation System. New safety management system scheduled for implementation in Fall 2021 will be able to evaluate State and local road projects.
- Washington: measures systemic projects on a larger scale (often agency wide) in a simple before-after comparison.

# Noteworthy Examples, Challenges, and Opportunities

## Noteworthy Examples

- Use simple methods for project evaluations
- Use advanced methods for systemic and countermeasure evaluations
- Focus on change in target crashes rather than total crashes for project evaluations
- Share evaluation results
- Develop tools/spreadsheet to facilitate EB analysis
  - NC's spreadsheet tool updates CMFs automatically as new sites are added
  - NY's PIES tool automates process

# Noteworthy Examples, Challenges, and Opportunities

## Challenges

- May be difficult to identify specific project locations for bundled systemic projects (e.g., if project records indicate “multiple locations” without listing specific sites)

# Noteworthy Examples, Challenges, and Opportunities

## Challenges

- Time consuming to properly evaluate systemic projects
  - Large number of treated locations
  - Need to confirm associated data (e.g., construction date, locations, crash data)
  - May not be feasible to perform detailed crash analyses for each systemic site

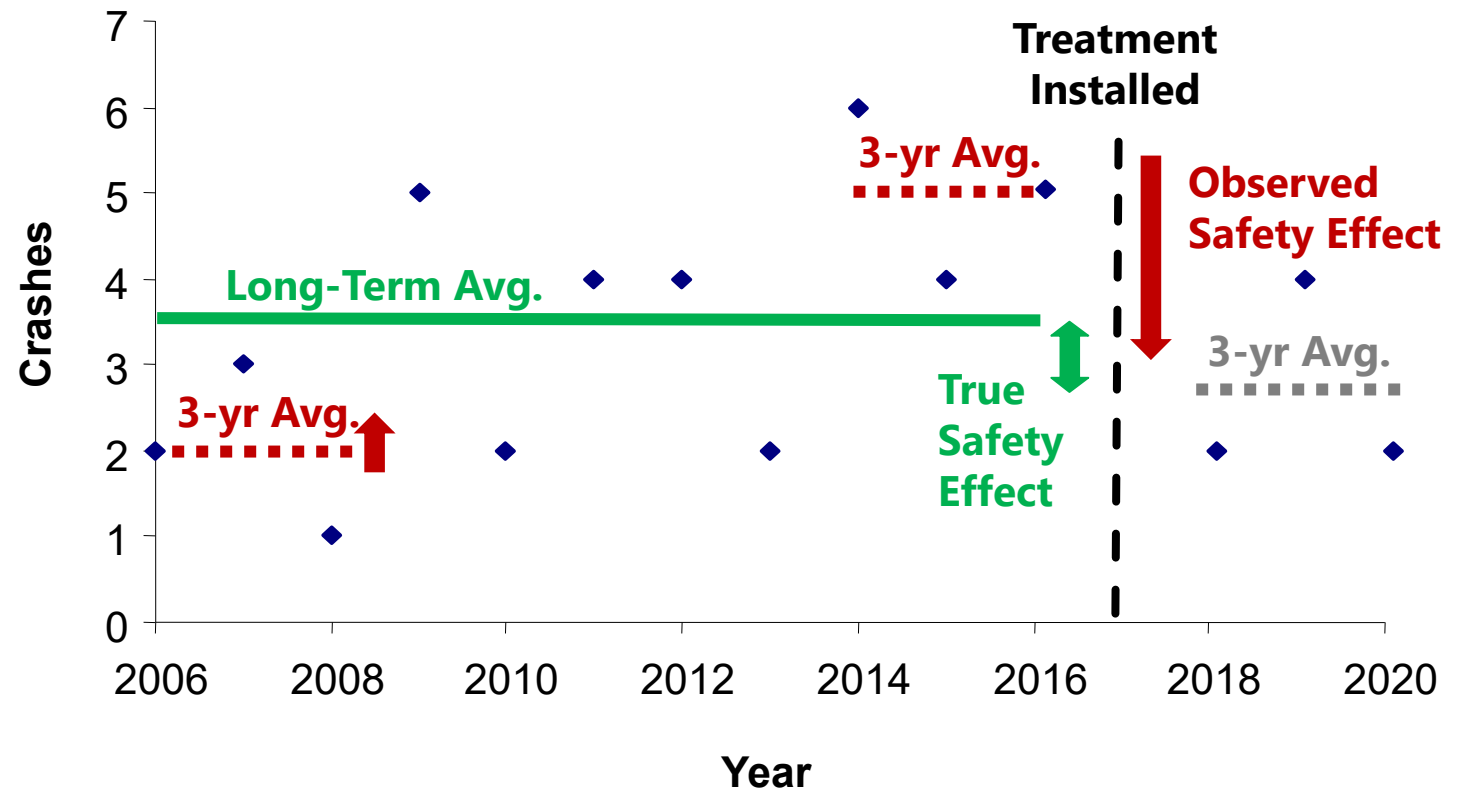

# Noteworthy Examples, Challenges, and Opportunities

## Challenges

- Regression-to-the-mean
  - Hot-spot: sites selected based on high crashes before implementation
  - Systemic: sites with few or no crashes before implementation

# Noteworthy Examples, Challenges, and Opportunities

## Opportunities

- Use more rigorous methods
  - Account for regression-to-the-mean
- Develop guidance or training
  - Document nuances of evaluating systemic improvements
- Evaluate effectiveness of systemic countermeasures
  - Determine if effectiveness remains as prevalence increases (i.e., is strategy as effective at sites with lower potential for safety improvement)
- Share evaluation results
  - Convince people (internal and external) of potential benefits of systemic
  - Retain (and even increase) safety funding
  - Increase confidence in investments

# Illinois Safety Evaluation

Katherine Beckett, P.E., RSP2 B/I

December 15, 2021

# Illinois Safety Evaluation

- Overview
- Data
- Challenges and solutions
- Methodology
- Results
- Communication and use of results
- Future development of evaluation

# Overview

- Objectives
  - Understand the effectiveness of individual HSIP project investments, countermeasures and overall program
  - Identify opportunities to improve HSIP allocation to maximize the return on investment
  - Inform future decisions regarding investment location, project type and conditions
  - Use evaluation results to proactively enhance and improve the program
- Develop a tool to evaluate the effectiveness of all HSIP investments
  - After SAFETEA-LU and the shift to reducing fatalities and serious injuries
  - User friendly, versatile, informative
  - Accessible by practitioners and leaders, state and local agencies

# Data Summary

- HSIP Applications Data
  - Over \$300M in projects
  - 1,037 HSIP Applications + Attachments
  - State and local jurisdiction segments, intersections, corridors
- Contract Data
  - All Contracts Using Safety Funds and programmed after 2004
  - 905 Programmed Contract Numbers
  - Approximately 2600 miles
- Construction Data
  - Contract Plans
  - Contract Pay Items
- Crash Data
  - KAB crash severities
  - 2001 to 2016

# Challenges & Solutions

- Expansive range of roadway conditions
- Safety performance functions (SPFs) available for state routes only
- SPF were not calibrated for all of the years
- Data set too large, varied for empirical bayes
- Project data
  - Actual contract may differ from HSIP application in the geographical extent or the scope of work
  - Type of treatment was too general for the purpose of evaluation
- Evaluation Based on Construction Data
  - Improved location accuracy
  - Treatment based on plans and pay items
- Large data over many years
  - Reduced the effect of regression to the mean

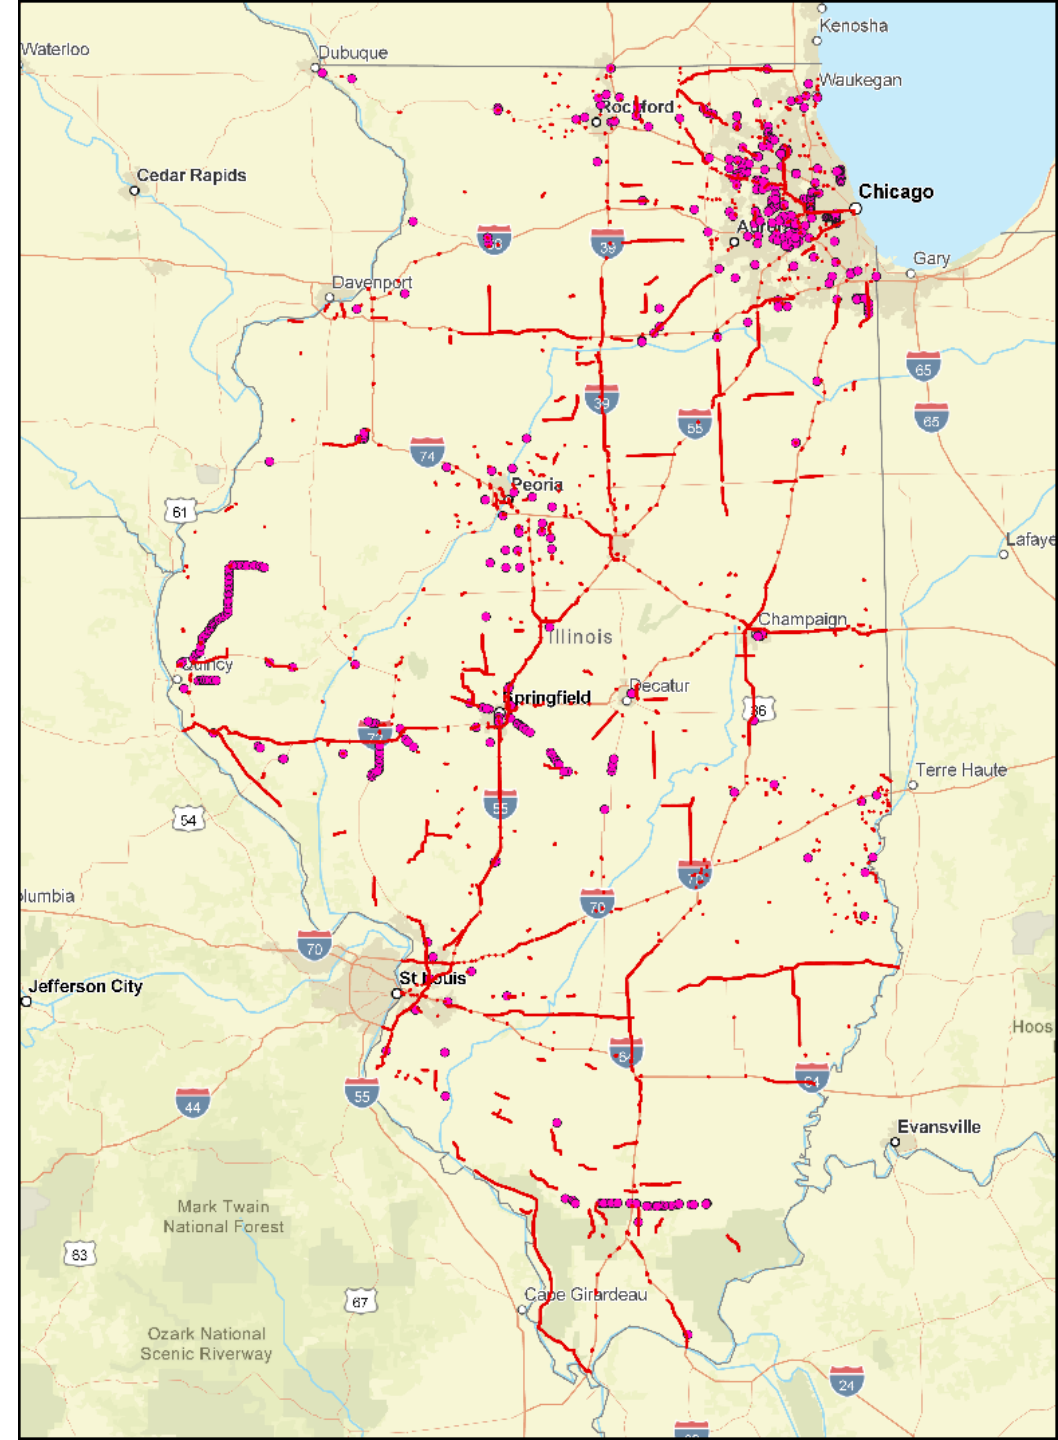

# Summary of Contracts Evaluated

	Number of Evaluated Contracts	Total Completion Amount	Total HSIP Funds
Total	370	\$314.9M	\$227.7M
State HSIP	309 (84%)	\$274.9M (87%)	\$203M (89%)
Local HSIP	61 (16%)	\$40.0M (13%)	\$24.7M (11%)
Hotspot	273 (74%)	\$238.7M (76%)	\$163.8M (72%)
Systemic	97 (26%)	\$76.2M (24%)	\$63.9M (28%)

# Extensive Evaluation

- 370 Contracts
- +2100 Miles
- +500 Intersections
- +86,000 KAB Crashes in Before-Period
- +71,000 KAB Crashes in After-Period
- 2004 Before Contract-Years
- 1892 After Contract-Years

# Analysis Methodology

- Benefit-Cost Analysis

- Total Completion Amounts (2019 Dollars): **\$367.96M**
- Total HSIP Funds (2019 Dollars): **\$266.36M (72%)**
- Total Statewide BC Ratio based on Completion Cost: **9.61**
- Total Statewide BC Ratio based on HSIP Funds: **13.27**

- Crash Modification Factor development

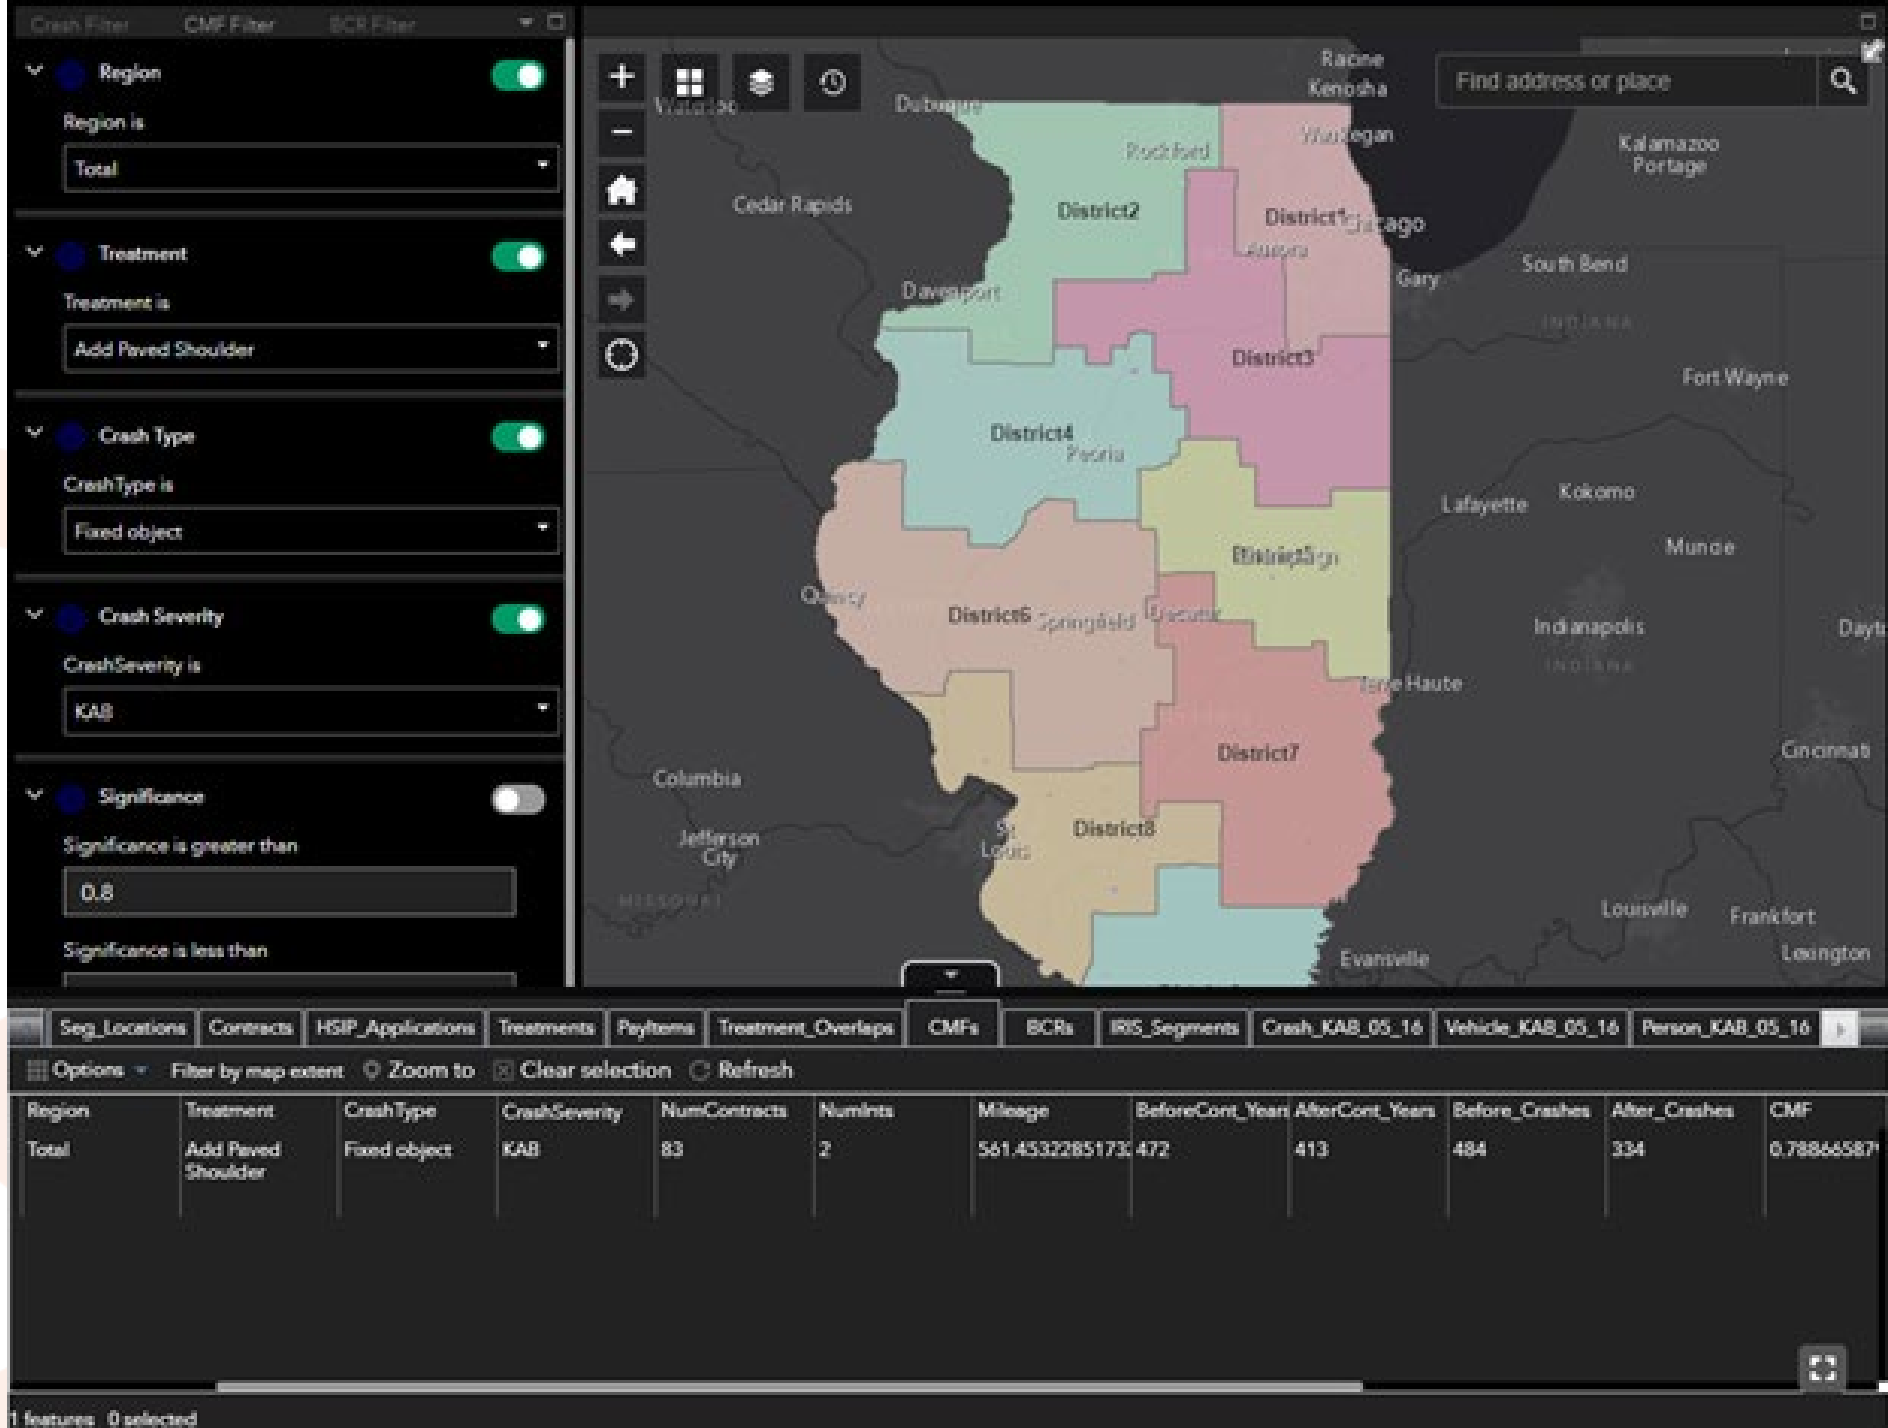

Statewide BCs by Overall Treatments (KAB)  
Size Represents Significance Level (95%, 90%, 80%)

Statewide CMFs by Overall Treatments and Crash Types (KAB)  
Size Represents Significance Level (95%, 90%, 80%)

# Summary

- Outcomes

- Understand the effectiveness of individual HSIP project investments, countermeasures and overall program
- Identify opportunities to improve HSIP allocation
- Outcomes are guiding future investments

- HSIP Investment Evaluation Tool

- User friendly, versatile, informative
- Review specific sites or group by attributes
- Online portal accessible by practitioners and leaders

# Future Developments

- HSIP Safety Evaluation
  - Add additional crash data through 2020
  - Add additional construction contracts
  - Updating local SPFs
  - Compare state CMFs to CMF Clearinghouse; update IL Benefit Cost Tool
  - Continue to integrate evaluation output in project programming and development
- Evaluation Highway Safety Program enforcement investments

1	<b>Intersection Evaluation Workbook – Steps/Instructions</b>																												
2	<b>Overall Comments on the workbook:</b>																												
3	<ul style="list-style-type: none"><li>Throughout the workbook, cells that are shaded in with a light brown/tan color need to be changed or edited.</li><li>The selection of the project's target crashes should be confirmed via the assumptions email prior to any analyzing or filtering of the original fiche.</li><li>The "Typical Target Crash Types" tab should help with the selection of target crashes. This tab lists the typical target crashes by countermeasure.</li></ul>																												
4	<b>Steps:</b>																												
5	<b>1. Date Range Calculator</b>																												
6	<ul style="list-style-type: none"><li>Edit the cells within the calculator that the color key indicates need to be changed.</li><li>The calculator should automatically calculate the study's date range for its before and after period. Use these dates to pull crash data from TEAS.</li><li>We recommend pulling crash data a few months prior to the start of the before period in case the date ranges have to be moved back a few months (ex: finding out a longer construction period is needed).</li><li>Median years will also be calculated in this table. These are no longer used for AADT calculations, but they can still be used as a reference.</li><li>NOTE: This tool only works in WHOLE MONTHS. Construction start dates should be rounded up to the first of the month and construction end dates should be rounded down to the end of the month.</li><li>Move on to the AADT calculations once the date ranges are finalized.</li></ul>																												
7	<b>2. AADT Calculator</b>																												
8	<ul style="list-style-type: none"><li>This calculator automatically finds the intersection's volume for the years that are chosen to be representative of the before and after period.</li><li>Follow the instructions that are bulleted to the right of the main table.</li><li>In cells W4 and W5, select the last year within each period where the subject intersection has at least one leg with available volume data (i.e. actual collected volume data, not estimated/interpolated data). This is the year that should be considered representative of the period. Starting in late 2020, we no longer automatically consider the median year to be the representative year.</li><li>Enter in volumes for every full calendar year within the study's before and after period.</li><li>Input volume data for each leg of the intersection.<ul style="list-style-type: none"><li>Use Black font color for values DIRECTLY from the available volume data.</li><li>Use Red font color for values that needed to be calculated, interpolated, or assumed.</li></ul></li><li>Once volumes are calculated, pull the fiche from the TEAS application and filter/review the crashes.</li></ul>																												
9	<b>3. Original Fiche and Filtered Fiche Tab</b>																												
10	<ul style="list-style-type: none"><li>Pull the fiche from the TEAS application.</li><li>Copy the original Fiche from the TEAS application into the "Original Fiche" tab and "Filtered Fiche" tab.</li><li>Leave the copied data in the Original Fiche Tab as is, but feel free to edit/manipulate the data in the filtered fiche tab as you see fit.</li><li>Filter the fiche as you normally would to find the in-study crashes</li></ul>

# Location Specific Safety Evaluations

## Location Specific Evaluation Report

Order ID:	41000051484
Project ID:	06-17-48582
Signal ID:	n/a
Location:	SR 1002 (Old Allenton Rd) at SR 2104 (Seventh St Rd)
GPS Coordinates	34.625564, -78.921555
County:	Robeson
City:	East of Lumberton
Division:	6

Countermeasure(s):	Convert from a two-way stop to an all-way stop
Project Cost:	\$12,500

	Start Date	End Date	Length
Before Period	9/1/2014	8/31/2017	3y, 0m
Construction Period	9/1/2017	9/30/2017	0y, 1m
After Period	10/1/2017	9/30/2020	3y, 0m

Analysis Criteria:	Treatment data consists of all crashes within 150 feet of the subject intersection
--------------------	--

Target Crashes:	Frontal Impact Crashes (left-turn, same roadway; left-turn, different roadway; right-turn, same roadway; right-turn, different roadway; head-on, and angle crashes) in the intersection.
-----------------	--

### Project Development Comparison

Crashes Per Year by Project Time Period	Project Development	Before Period	After Period
Years	5 years	3 years	3 years
Start Date	7/1/2012	9/1/2014	10/1/2017
End Date	6/30/2017	8/31/2017	9/30/2020
Total	3.40	4.33	1.00
Fatal Injury	0.00	0.00	0.00
Class A Injury	0.20	0.00	0.33
Class B Injury	0.60	1.00	0.00
Class C Injury	1.60	2.00	0.33
Property Damage Only	1.00	1.33	0.33

### Items for Discussion

The single A-injury crash in the after period involved a vehicle failing to stop at the all way stop. This crash occurred in the first month of the after period after the all way stop was in place. There were no crashes in the last year of the study after period.

The implementation of the countermeasure at this intersection significantly reduced total crashes (-77%) and target crashes (-80%), however, the average severity index significantly increased for both total and target crashes (100+% each). Although the total and target crash severity indices increased after improvements were made, there was a decrease in the frequency of injury total and target crashes from the before to the after period. The severity index is calculated as a weighted average where Fatal and A injury crashes receive the same weight (76.8) and B and C injury crashes receive the same weight (8.4). Even though there was a reduction in B and C injury crashes, the one A injury crash in the after period made up a higher proportion of total and target crashes in the after period, which led to the increased total and target severity indices.

Treatment Information	Before	After	Percent Reduction (-) Percent Increase (+)
Total Crashes	13	3	-76.92%
Total Severity Index	6.12	28.73	100+%
Target Crashes	10	2	-80.00%
Target Crash Severity Index	6.18	42.60	100+%
Volume (2017, 2019)	5,200	5,000	-3.85%

Injury Crash Summary	Before	After	Percent Reduction (-) Percent Increase (+)
Fatal Injury Crashes	0	0	n/a
Class A Injury Crashes	0	1	n/a
Class B Injury Crashes	3	0	-100.00%
Class C Injury Crashes	6	1	-83.33%
Property Damage Only	4	1	-75.00%

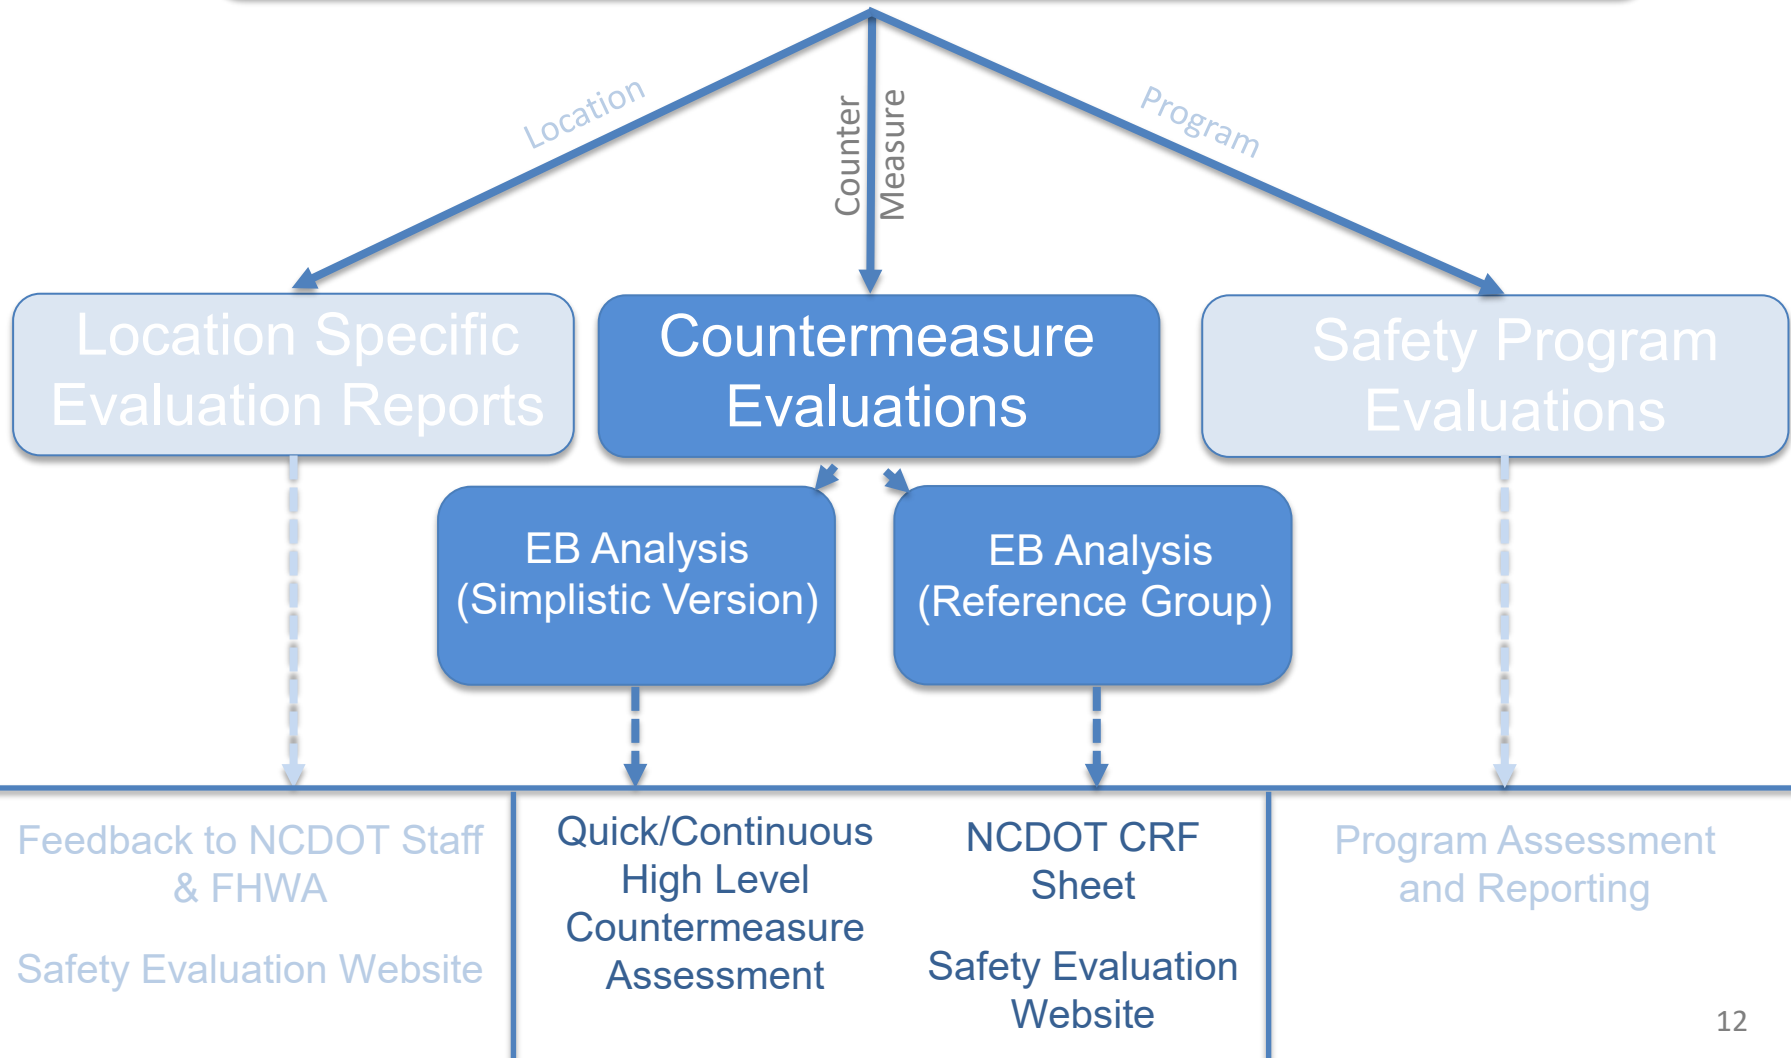

Target Injury Crash Summary	Before	After	Percent Reduction (-) Percent Increase (+)
Fatal Injury Crashes	0	0	n/a
Class A Injury Crashes	0	1	n/a

## CMF Workbook (Intersection - Simplistic)

THIS SPREADSHEET IS A TOOL USED TO FACILITATE THE DEVELOPMENT OF CMFS FOR SPECIFIC PROJECT TYPES FUNDED THROUGH OUR SPOT SAFETY AND HAZARD ELIMINATION PROGRAMS. AS PROJECTS ARE EVALUATED AND ADDED TO THE WEB, IT IS OUR INTENT TO UPDATE THIS SPREADSHEET WITH NEW SITES AND NEW COUNTERMEASURES. WE MAY DECIDE TO USE THE CMFS FOR A PARTICULAR COUNTERMEASURE ONCE WE HAVE ESTABLISHED A LARGE ENOUGH SAMPLE SIZE AND NUMBER OF SITES.

Intersection Countermeasures	Classification on Web	# Sites	EB CMFs Developed						Simple B-A CMFs Developed

## CMF Workbook (Intersection - Detailed)

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y	Z	AA	AB	AC	AD	AE	AF
1	<b>Step 1.</b> Enter in the below information for each of the reference sites. Both of the Major and Minor roads of each reference site need an inputted volume for EVERY year within the study's period.						<b>NOTE:</b> This tab is set up to work with 200 Reference sites. If rows are added in the case of having more than 200 reference sites, the automated formulas in the blue cells to the right will need to be dragged/copied.										<b>NOTE: DO NOT</b> insert in any rows below the red line at the bottom of this tab. The automated formulas will work up until the red line. If more rows are needed, right click and "insert" new rows above the red line.															
5	For Example, If your earliest before period year is 2005 and your latest after period year is 2018, then you need volumes for both the major and minor roads for every year within 2005 - 2018

# Countermeasure Evaluations

## NCDOT Traffic Safety Unit Programs

## North Carolina Project Development Crash Reduction Factor (CRF) Information

### Evaluation of Roundabouts on High-Speed Roadways

NCDOT completed a safety study of 13 intersections in North Carolina where a high speed (at least one 55 mph approach) roundabout was installed. A majority of the study locations were converted from a stop-controlled intersection to a roundabout as a safety countermeasure to mitigate frontal impact crashes.

#### Background

All of the roundabouts included in this study effort were located in rural areas and were converted from minor road stop-controlled intersections. Additionally, all of the roundabouts in the study were single lane and had at least one leg with an approaching speed limit of 55 mph. The included roundabouts had inscribed circle diameters between 100 and 160 feet and had an average major road volume of 6,000 AADT and an average minor road volume of 3,600 AADT.

*The Empirical Bayes methodology was utilized to provide a more robust statistical analysis of the data. The purpose of the evaluation is to measure changes in total intersection crashes, fatal and injury crashes, and frontal impact crashes after intersections were converted to roundabouts.*

Top: Aerial View of a rural roundabout included in the study  
Middle: Roundabout located near South Stanly High School in North  
Bottom: Roundabout located in Clemmons

#### Results

The overall results from all study locations indicate a:

- **41% Reduction** in Total Crashes,
- **79% Reduction** in Fatal and Injury Crashes, and
- **62% Reduction** in Frontal Impact Crashes.

#### Other key points of the study:

- The results are similar to the crash reductions previously determined in an NCDOT study of 30 intersections converted from two-way stop sign control or from signalization to a roundabout in urban, suburban and rural areas with varying ranges of volumes and approach speeds.
- The reductions in Total Crashes were similar regardless of whether the intersection has three legs or four legs.

## North Carolina Department of Transportation Traffic Safety Unit

NCDOT Reference Number	Countermeasure Location Type	Countermeasure	CRF Site Specifications	CRF Crash Pattern Affected	CRF
<b>2.1 - One-Lane Roundabout</b>					
2.1.1	Intersection	Two-Way Stop to One-Lane Roundabout	Urban and Suburban	Injury Crashes	78
2.1.2	Intersection	Two-Way Stop to One-Lane Roundabout	Rural, At least one 55 mph approach	Injury Crashes	79

# PennDOT's Highway Safety Improvement Program Project Evaluations

## ► Today's PennDOT Speaker

Jason Hershock

Manager – Safety Engineering & Risk Management Unit  
Pennsylvania Department of Transportation  
Highway Safety & Traffic Operations Division

## ➤ Today's Presentation

# Overview of HSIP Project Evaluation Process

- Data Collection Process
- Tools for Evaluation Process
- Methodology- Systemic & Spot Locations
- Utilizing the Results
- Challenges to the Analysis
- Next Steps and Future Evaluations

## ➤ Data Collection

- Review of 424 projects from 2002 to 2017 (over \$560 million in HSIP funds)
- Analysis of fatal and serious injury crashes
  - Pull from CDART and PCIT
  - Use Pennsylvania SPFs for base conditions
  - Refer to CMF clearinghouse for expected performance of countermeasures and compare project results
- Video log, RMS, and TIRe
- Funding by MPO, District, and Countermeasure types
- Use PennDOT's MPMS and ECMS systems for project information
  - Contains project locations,
  - Scope of work descriptions,
  - Special provisions,
  - Project plans and drawings,
  - Itemized costs for countermeasures,
  - Project let or Notice to proceed dates, open to traffic dates (OTT)

# ➤ Analysis Tools

- No special off-the-shelf tool.
- PennDOT developed our own tools to complete the HSIP project evaluations
- Consultants developed large workbook with multiple spreadsheets with VB coding

Table 2-27. HSIP Funds Spent by Improvement Type (2002-2015)

Improvement Category	2002-2007	2008	2009	2010	2011	2012	2013	2014	2015	Total
Alignment	\$2,199,882	\$184,043	\$2,459,193	\$1,908,199	\$31,017	\$11,368,853	\$0	\$1,507,828	\$6,487,081	\$26,146,096

## ➤ Methodology

- Gather complete list of all HSIP Projects from 2002 up to 2017
- Determine countermeasures used in every project
- Exclude construction by identifying the NTP and OTT dates for every project
- Compare observed data to predicted models if CMFs exist for improvement
- Assess project successes and failures
- Systemic projects assessed network wide, not by site alone
  - Allocated costs proportionally

Proj. ID	HSIP Project ID	PennDOT Description	County	SR	Beg Sec	Beg Off	End Sec	End Off	Length (ft)	AADT

# Results

- Many ways to present data analysis
  - Statewide
  - Districts
  - MPOs and RPOs
  - Counties
  - Funds spent on focus areas vs. needs
  - Predicted vs. Observed crashes
  - Benefit Cost Analysis
  - Countermeasure Analysis
  - Systemic vs. Spot Locations
  - Urban vs. Rural
  - Roadway Classifications
  - Exposure to Licensed Drivers

## ➤ Statewide HSIP Spending: SHSP Priority Focus Area

SHSP Priority Focus Area	Number of Projects	Number of Sites	HSIP Funds Spent (\$M)
Intersection Safety	198	1,176	\$302.9
Lane Departures	156	2,660	\$148.0
Pedestrians and Bicyclists	4	4	\$4.3
Other Priorities	66	140	\$107.1
<b>TOTAL</b>	<b>424</b>	<b>3,980</b>	<b>\$562.3</b>

## ➤ Statewide Crashes – for comparison to spending

Crash Type	5-Year Average (2016-2020)		Percent of Crashes (2016-2020)	
	Fatalities	SSI	Fatalities	SSI
<b>Intersections</b>	<b>276</b>	<b>1,505</b>	<b>24%</b>	<b>34%</b>
Signalized	103	575	9%	13%
<b>Lane Departures</b>	<b>588</b>	<b>1,869</b>	<b>52%</b>	<b>42%</b>
Single Vehicle Run-Off-Road	491	1,780	43%	40%
Hit Fixed Object	386	1,369	34%	31%
Head On / Opp Dir Side Swipe	153	614	13%	14%
<b>Pedestrians &amp; Bicyclists</b>	<b>184</b>	<b>551</b>	<b>16%</b>	<b>12%</b>
Pedestrians	165	457	14%	10%
Bicyclists	19	94	2%	2%

**52% of  
HSIP  
Spending**

## ➤ Statewide HSIP Spending: Project Performance

Year	Projects Completed	HSIP Funds Spent (Millions)	Before F+SSI Crashes/ Year	After F+SSI Crashes/ Year	% Change F+SSI Crashes
2002-2007	100	\$99.1	601	531	-12%
2008	26	\$12.2	259	215	-17%
2009	21	\$17.9	31	22	-29%
2010	24	\$26.2	130	107	-18%
2011	28	\$24.0	85	88	4%
2012	28	\$45.2	196	151	-23%
2013	20	\$50.6	98	112	14%
2014	32	\$70.1	67	68	1%
2015	45	\$60.0	271	255	-6%
2016	53	\$67.4	326	289	-11%
2017	47	\$89.6	432	456	6%
<b>Total</b>	<b>424</b>	<b>\$562.4</b>	<b>2,436</b>	<b>2,295</b>	<b>-6%</b>

## ➤ Statewide HSIP Spending: Spot vs Systemic

Type of Projects	HSIP Funds Spent (\$M)	Before F+SSI Crashes	After F+SSI Crashes	Cost per F+SSI Reduction (\$M)
<b>Spot Improvements</b>	\$390.0	469	442	\$14.44
<b>Systemic</b>	\$172.3	1,967	1,852	\$1.50
<b>Total</b>	\$562.3	2,436	2,294	\$3.96

# Statewide HSIP: Spot vs. Systemic—Benefit/Cost Ratio

## ➤ Statewide HSIP Performance: Functional Classification

Functional Classification	HSIP Funds Spent (\$M)	Before F+SSI Crashes	After F+SSI Crashes	F+SSI Crash Change (%)
Rural Minor Collectors	\$12.6	82	52	-37%
Rural Major Collectors	\$41.0	186	124	-33%
Rural Other Principle Arterials	\$91.8	245	189	-23%
Rural Local Roads	\$11.6	24	19	-21%
Rural Minor Arterials	\$81.7	363	291	-20%
Urban Major Collectors	\$25.8	85	78	-8%
Undefined	\$3.9	128	122	-5%
Urban Minor Arterials	\$82.3	217	208	-4%
Rural Interstate	\$20.6	447	434	-3%
Urban Minor Collectors	\$0.0	0	0	0%
Urban Other Principle Arterials	\$153.5	536	564	5%
Urban Interstate	\$13.6	53	57	8%
Urban Other Freeways and Expressways	\$20.4	124	145	17%
Urban Local Roads	\$3.5	6	11	83%

## ➤ Statewide HSIP Project Performance: Urban vs Rural

	HSIP Funds Spent (\$M)	Before F+SSI Crashes	After F+SSI Crashes	% Change F+SSI Crashes
Urban	\$299.1	1,021	1,062	+4%
Rural	\$259.3	1,347	1,109	-18%
Not Defined	\$3.9	128	123	-4%
<b>Total</b>	<b>\$562.3</b>	<b>2,496</b>	<b>2,294</b>	<b>-8%</b>

Lesson: Safety improvements on rural roads were much more effective

# ➤ Predicted vs. Observed Performance

Improvement Type	Improvement Sub-Type	Before F+I	After F+I	After F+I with CMF
Alignment	-	199	96	123
Auxiliary Lanes	Add Left-Turn Lane	321	233	254
Auxiliary Lanes	Add Right-Turn Lane	92	116	69
Auxiliary Lanes	Extend Existing Left-Turn Lane	316	244	282
Auxiliary Lanes	Other/Unknown	377	332	288
Barrier	Guardrail Replacement with New W-beam	2,575	2,537	2,405
Barrier	High Tension Cable Median Barrier	387	451	226
Barrier	Median - Concrete	509	484	55
Barrier	Median - W-beam	56	97	49
Barrier	New Guardrail at Unprotected Bridge Ends	10	4	8
Barrier	Other	3	9	0
Barrier	Remove Guardrail	1	1	0
Delineators	-	101	120	89
High Friction Surface Treatment	-	447	250	189
Intersection Geometry	-	474	272	350

- Used dominant CMF for project analysis
- For analysis of PennDOT's HSIP projects, CMFs applicable to all crash types were selected when possible

Improvement Type	Improvement Sub-Type	Before F+I	After F+I	After F+I with CMF
Lighting (interchange)	-	4	10	3
Modify Traffic Signal	Coordination/Timing	457	463	418
Modify Traffic Signal	Replace Existing Indications	521	483	544
New Traffic Signal	-	401	264	331
Pavement Surface	Resurfacing	222	249	176
Pedestrian and Bicycle	Pedestrian Signal	991	1,064	943
Roadway Widening - add lane(s)	-	181	119	103
Roundabout	-	7	3	6
Rumble Strips	Center Line	1,326	956	866
Rumble Strips	Edge Line	241	233	152
Rumble Strips	Unknown or Both	1,083	922	879
Rumble Strips	Remove Non-Compliant Rumble Strips	6	9	5
Shoulder Widening	-	65	67	23
Signing and Pavement Markings	Curve-Related	1,168	891	1,119
Signing and Pavement Markings	Intersection-Related	431	354	392
Signing and Pavement Markings	Interstate Signs	2,209	1,963	2,193
Signing and Pavement Markings	Other/Unknown	190	244	167
Signing and Pavement Markings	Raised Pavement Markers	4,384	4,151	3,555
Signing and Pavement Markings	With Flashers	23	12	23

- CMFs for fatal and injury crashes were used rather than CMFs for total crashes for severity
- For consistency, these results used Fatal and injury crashes

# ➤ Most Effective Safety Countermeasures

Improvement Type	Improvement Sub-Type	Before F+SSI Crashes	After F+SSI Crashes	Project Cost	Cost to Eliminate a F+SSI	Net Benefit	F+SSI B/C Ratio
Rumble Strips	Unknown or Both	116	110	\$700,000	\$116,667	\$46,491,600	66.4
Signing and Pavement Markings	Curve-Related	124	82	\$4,373,383	\$104,128	\$260,637,434	59.6
Modify Traffic Signal	Replace Existing Indications	28	17	\$616,787	\$56,072	\$26,680,853	43.3
Rumble Strips	Center Line	116	86	\$4,257,153	\$141,905	\$154,526,315	36.3
Signing and Pavement Markings	Intersection-Related	48	34	\$3,462,916	\$247,351	\$115,801,524	33.4
Rumble Strips	Edge Line	29	24	\$4,816,057	\$963,211	\$56,582,863	11.8
High Friction Surface Treatment	-	26	19	\$6,933,117	\$990,445	\$47,146,600	6.8
Signing and Pavement Markings	Interstate Signs	184	175	\$1,434,906	\$159,434	\$8,103,725	5.7

# ➤ Least Effective Safety Countermeasures

Improvement Type	Improvement Sub-Type	Before F+SSI Crashes	After F+SSI Crashes	Project Cost	Cost to Eliminate a F+SSI	Net Benefit	F+SSI B/C Ratio
Signing and Pavement Markings	Raised Pavement Markers	295	306	\$2,028,000	-\$184,364	-\$52,713,043	-26.0
Pedestrian and Bicycle	Pedestrian Signal	51	57	\$3,835,186	-\$639,198	-\$34,203,386	-8.9
Barrier	High Tension Cable Median Barrier	30*	37*	\$7,295,629	-\$1,042,233	-\$57,190,617	-7.8
Auxiliary Lanes	Other/Unknown	15	22	\$8,114,334	-\$1,159,191	-\$25,971,663	-3.2
Modify Traffic Signal	Coordination/Timing	13	23	\$6,012,716	-\$601,272	-\$12,580,345	-2.1
Modify Traffic Signal	Replacement	44	41	\$22,503,950	\$7,501,317	-\$38,948,786	-1.7
Auxiliary Lanes	Add Right-Turn Lane	8	12	\$15,715,364	-\$3,928,841	-\$12,436,493	-0.8

\* Values reflects total crashes, and are not isolated to Cross Median crash events

## ➤ Challenges to Analysis

- Over the last two decades there have been several personnel changes and policy changes
- Project justification for project from years ago
  - How projects qualified for HSIP funds has changed
  - At least 95 projects did not have an apparent safety justification
    - Bridges, bridge de-icing, , and others
- Older projects' data had broad scope
- Older projects did have some changes to segment and offset due to alignment projects
- Some Routes had changed route numbers
- Change in the definition of serious injuries in 2016
- Limited crash data for some years
  - Older projects and newest projects (Only keep 20 years of crash data)

## ➤ Next Steps

- Update HSIP project analysis annually
- Use analysis data to make changes to the HSIP
- Include more systemic safety projects
- Determine better options for safety projects in urban areas
- Complete more detailed analysis on specific countermeasures
  - Like ATSCs and HTCMBs
- Mandated HSM based project justification for any spot location project
- Expand State's Highway Safety Network Screening to local roads
- Make data sets easier to combine for future analysis
- Create a new HSIP project applications website
  - Current SharePoint site is at critical point/maximum ability

## ➤ Final Lesson Learned

We also found from 2002 to 2017 there were no reported cases of Grandma getting runover by a reindeer in Pennsylvania

# Questions

# GDOT Safety Engineering Program: Safety Evaluation

**Samuel Harris, PE**

**State Safety Engineering Manager**

**December 15<sup>th</sup>, 2021**

# Three Takeaways

1. Data Collection
2. Crash Analytics = Numeric
3. Evaluation of Program and Projects

SR 20 @ Simpson Mill Rd, Henry County, GA

# Agency Overview

# **Data Collection Process**

NUMBER 26, 2021 • \$2      CARROLL COUNTY'S TRUSTED INFORMATION LEADER SINCE 1871

## **Study: I-20 second most dangerous U.S. highway**

**BY TAYLOR JACKSON**  
THE TIMES-GEORGIAN

The U.S. Department of Transportation's National Highway Traffic Safety Administration found I-20 to be the second most dangerous highway in the United States.

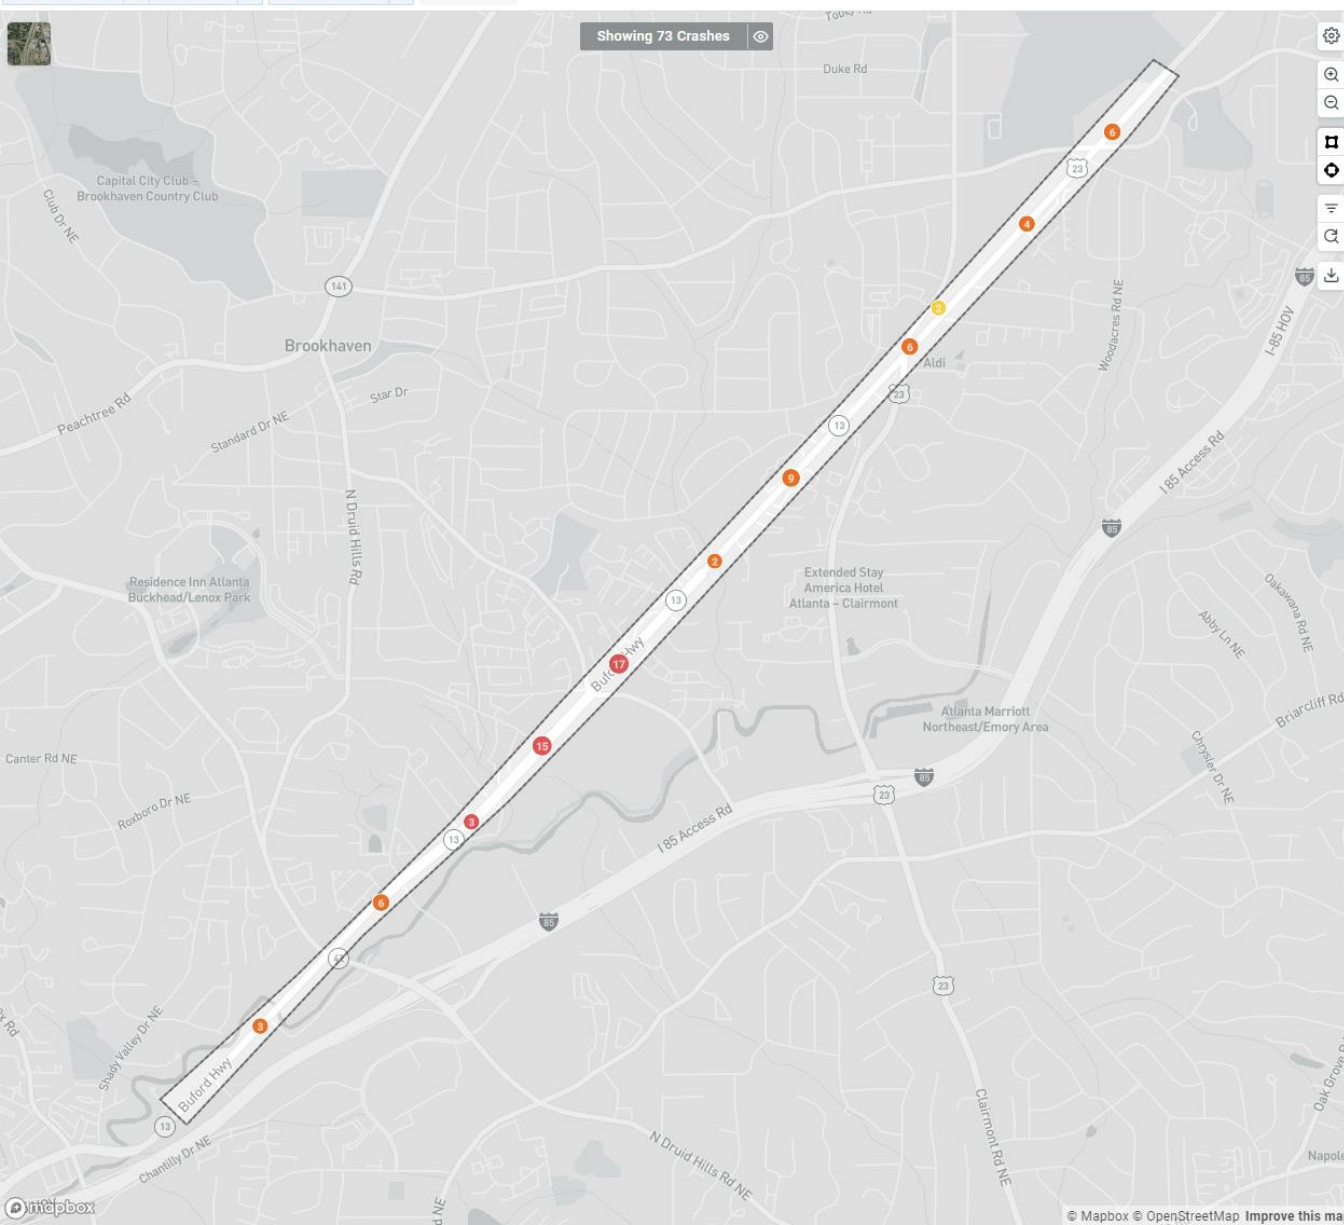

According to 2019 data, I-20 has the second-highest rate of fatalities per mile with 208 fatalities (13.52 fatalities per 100 miles).

Danielle Marchell, licensed insurance agent and spokesperson for the Zebra (an Austin, Texas-based insurance comparison site), told the Times-Georgian on Tuesday that an estimated 20,160 people died in motor vehicle crashes in the first half of 2021, which is 18.4% more than last year (the largest number of projected fatalities in that time period since 2006).

"The U.S. Department of Transportation's National Highway Traffic Safety Administration has not fully released [numbers for] 2020 and 2021 yet, but there are estimates that 2021 is on track to be one of the deadliest years ever on the road," said Marchell.

## Memorandum

**Subject:** Memorial Drive Road Diet Before and After Crash and Speed Analysis

**Date:** November 12, 2021

**To:** Sam Harris, PE  
State Safety Engineering Manager, GDOT

**From:** Carly Queen  
Sustainable Transportation Specialist, AECOM

The Georgia Department of Transportation (GDOT) Safety Office requested that AECOM perform a before and after analysis of crash data and vehicular speeds for the SR 154 / Memorial Drive corridor from Pearl St to SR 155 / Candler Rd to better understand the impacts of PI M005724, the resurfacing and road diet project completed in the first half of 2019. This memo provides a summary of the analysis findings and results including:

- Statistically significant reductions in quarterly crash totals and rates (crashes/AADT) were observed
  - Crashes were reduced by 39% (36% for injury crashes)
  - Crash rates (crashes/AADT) were reduced by 45% (38% for injury crash rates)
- Hourly vehicle speeds and average delay in the corridor were similar before and after the project

### Before and After Road Diet Crash Analysis

The number of crashes in each quarter for 2-year periods before (Q3 2016 to Q2 2018) and after (Q3 2019 to Q2 2021) project construction are shown in Table 1. Quarterly crashes were reduced from an average of 125 before the project to an average of 76 after, representing a 39% reduction overall and 197 fewer crashes per year. The key for the linear color scale used in the Before and After quarterly crash total columns, based on a green to yellow to red scale with a midpoint (yellow) defined as the minimum quarterly crashes during the before period, is shown at the bottom of the table. The same colors are applied to the Ratio and Change columns using a scale of 0 (green) to 1 (yellow) to 2 (red) and -130 (green) to 0 (yellow) to 130 (red), respectively. A paired t-test was performed for the before and after crash data, which confirmed a statistically significant reduction in crashes (at the 1% significance level) after the road diet was implemented.

Table 1 - Before and After Quarterly Crash Data for SR 154

Quarter	Before	Quarter	After	Ratio	Change
Q3 2016	124	Q3 2019	100	0.81	-24
Q4 2016	118	Q4 2019	90	0.76	-28
Q1 2017	135	Q1 2020	90	0.67	-45
Q2 2017	148	Q2 2020	18	0.12	-130
Q3 2017	127	Q3 2020	55	0.43	-72
Q4 2017	128	Q4 2020	79	0.62	-49
Q1 2018	110	Q1 2021	79	0.72	-31
Q2 2018	111	Q2 2021	97	0.87	-14
<b>Key</b>	<b>220</b>	<b>110</b>	<b>0</b>		

The before and after quarterly crash counts are also shown in Figure 1.

# Review of Historical Project Performance

- **R-Cut (16:1 AVG B/C)**
  - Our analysis showed an 89% reduction in both property damage only and injury/fatal crashes among vehicles crossing through or turning left from the side street.
- **Roundabout (12:1 AVG B/C)**
  - The Naïve method analysis identified an average 57% reduction in PDO crashes and 80% reduction in injury/fatal crashes at the intersections. The analysis also showed a 64% reduction in crashes for all manner of collisions.
  - [New Roundabout Design Guide](#)
- **Cable Barrier**
  - The crash rate analysis identified a 35% reduction of injury and fatal crashes and a 72% increase in PDO crashes.
- **Rumble Strips (100:1 AVG B/C)**
  - The crash rate analysis identified an average of 48% decrease in injury/fatal crashes per year on the roadway.
  - **New Policy update**
- **Pedestrian Hybrid Beacon**
  - In analyzing the mid-block pedestrian crashes, an 86% decrease in injury/fatal mid-block pedestrian crashes occurred. In analyzing all pedestrian crashes (at mid-block and at intersections) along the corridor where the project was constructed, a 46% decrease in all injury/fatal pedestrian crashes occurred.

## Safety Effectiveness Evaluation Process

**Kelvin Daratha, PE, PTOE**  
**HQ Traffic Operations**

# Background

Goal: Evaluate how effective safety \$ spent for hot spot projects

Technique for evaluating safety: Empirical Bayes (for B/A studies)

- Results in CMFs
- RTM
- Traffic Volume Changes

# Why Local CMFs?

- **Evaluate effectiveness of safety \$**
- WA specific driving behavior and conditions
- Assists in choosing a national level CMF when there are many CMFs
- Contribute to national literature
  - Not all countermeasures have a CMF defined
    - Road types, crash types, # lanes, etc
  - Strengthen Existing CMFs

CRASH MODIFICATION FACTORS CLEARINGHOUSE

**Better Data = Better Decisions**

# CMF Formation Tool

- WSDOT created a Microsoft Excel template to calculate the CMF
  - Methodology from HSM Chapter 9
  - Supports between 1-1,000 sites
  - Supports up to 10 yrs B & 5 yrs A
  - SPFs as Reference Group
  - Adjustment Factors (HSM Part C CMFs) to adjust for SPF baseline conditions
  - Calibration Factors

# CMF Formation Tool
